

superseded all-prewater seeding, new inundation by seed class (p95o); all regions

event-source network (largest connected component of the pre-breach water map): the seed of the primary rule
river-connected on the day: the flood

trapped after an earlier connection: retained-water candidate
isolated, never connected along its lineage: seeded by ponds / canals -- not event inundation

Recession, 2023-06-18: primary reconstruction and retained water of the memory sensitivity: plausible 1 | likely drained 0 | uncertain 6 km²
